

INTERNSHIP / PROJECT TECHNICAL REPORT

Gramy Hospital Website

Technical Documentation Report — a complete architecture, content, and quality audit of the local static website replica.

Read-Only Technical Audit

Project location: D:\ho

Reference site: <https://gramyhospital.com/>

Local site under test: <http://localhost:8000/>

Report generated: 2026-09-18

Document type: Technical Documentation Report (27 sections, 9 architecture diagrams)

Gramy Hospital Website — Technical Documentation Report

Project location: `D:\ho` **Report generated:** 2026-09-18 **Report type:** Read-only technical audit (no project files were modified, deleted, renamed, or created during this investigation, apart from this report file itself)

Reference site for comparison: <https://gramyhospital.com/> **Local site under test:** <http://localhost:8000/> (served via `python -m http.server 8000` from `D:\ho`)

1. Executive Summary

Item	Detail
Project name	Gramy Hospital — Local Website Replica
Project purpose	A local, static front-end reproduction of the Gramy Hospital hospital website, built from a browser-saved snapshot of the live site plus 14 hand-built specialist inner pages
Project type	Static HTML/CSS/JavaScript website. No server-side application code, no database, no build tool
Current implementation status	Homepage fully reproduced from the original save; 14 of the original site's ~14 "Specialities" categories have dedicated inner pages; the remaining ~136 pages of the live site (About, Contact, Gallery, News, Blog, doctor profiles, service pages, lab-test pages, shop) do not exist locally
Main technologies used	HTML5, CSS3, vanilla JavaScript, jQuery, Bootstrap 5 (CSS grid only, bundled inside theme CSS), Elementor page-builder output (static), Owl Carousel, Swiper, PhotoSwipe, Magnific Popup, Leaflet (loaded, unused), WooCommerce front-end assets (loaded, unused)
Number of pages	16 real pages: 1 homepage (duplicated as <code>Gramy Hospital.html</code> and <code>index.html</code> , byte-identical) + 14 specialist pages. (5 additional <code>.html</code> files exist but are internal template fragments, not standalone pages — see §7.)
Major features	Responsive homepage with hero slider, service grid, lab-test carousel, testimonial carousel, blog preview, mega-menu navigation with 14 localized specialist links; 14 specialist inner pages with real doctor listings, images, and body content sourced from the original site
Current limitations	No backend, no database, no working contact form, no site search, 123 of 137 general live-site pages absent, no doctor-profile pages, missing hero images on 5 specialist pages (dead source links on the live site itself), one unresolved rendering issue (mobile hamburger icon invisible; root cause not fully diagnosed)
Overall technical condition	Functionally stable as a static site: serves correctly over HTTP, all in-scope navigation resolves locally, no broken images or fonts remain within the 9 assets fixed this session. Content-complete for the pages it covers; structurally incomplete relative to the live site's full page count
Original vs local summary	The homepage and 14 specialist pages match the original site closely in layout, color, and content (see §21 for a category-by-category comparison, ~70% overall visual match at last full audit); the largest gap is breadth — 15 of the live site's ~150 pages exist locally

2. Project Overview

From a visitor's perspective, this is a hospital marketing/information website for "Gramy Hospital," a facility in Mumbai. It presents:

- **Target users:** prospective patients researching the hospital's specialities, doctors, and services; existing patients looking for contact/location information; general visitors browsing hospital credentials and facilities.
 - **Main purpose:** build trust in the hospital's expertise, list its medical specialities, introduce doctors, and drive phone-based appointment requests (there is no online booking form — every call-to-action is a `tel:` link).
 - **Main sections (homepage):** hero banner, "Visitor Information / Find a Doctor / Our Locations / Connect With Us" quick-link cards, About Hospital, Our Services (8-card grid), Why Choose Gramy, Lab Test Facilities carousel, testimonials, Download App promo, Healthcare Solution CTA, Blog & Articles preview, footer.
 - **Navigation flow:** top navigation bar with a "Specialities" mega-menu (14 items, now pointing to local pages), plus "iMiss," "Special," and "Diagnostic" dropdowns that still point to the live site (out of this project's build scope), and top-level links to About Us / Contact Us / Gallery / News / Blog (also still pointing live, since those pages were never built locally).
 - **Doctor/specialist information:** each of the 14 local specialist pages lists the real doctor(s) associated with that speciality (name, photo, designation) sourced directly from the live site — see §9.
 - **Contact/appointment functionality:** phone-only. Every "Call Us Now," "Book an appointment," and "Schedule a Test" button is a `tel:` link (`tel:02235347300` / `tel:022-35347300`). No web form exists anywhere in the project (verified: zero `<form>` elements in any HTML file).
 - **Other functionality discovered:** an embedded local video testimonial (via `<video>` , sourced from a remote URL — see §12), a photo-lightbox gallery (PhotoSwipe), and carousels (Owl Carousel for hero/services/lab-test, Swiper library also loaded).
-

3. Technology Stack

Technology	Version (if detectable)	Purpose	Where Used	Status
HTML5	—	Markup for all 16 pages	Every <code>.html</code> file	Actually used
CSS3	—	All visual styling	37 <code>.css</code> files in <code>GramyHospital_files/</code>	Actually used
JavaScript (vanilla)	—	Custom theme interactions	<code>hospa-main.js.download</code>	Actually used
jQuery	Bundled, version not printed in filename	DOM manipulation, plugin dependency base	<code>jquery.min.js.download</code> , <code>jquery-migrate.min.js.download</code>	Actually used
Bootstrap	5.x (grid/utility classes present: <code>col-lg-*</code> , <code>offset-lg-*</code> , <code>.container</code> , <code>.row</code>)	Grid system, embedded inside <code>hospa-main.css</code> ; separate JS bundle also loaded	<code>bootstrap.bundle.min.js.download</code>	Actually used
Elementor (page-builder output)	Kit ID <code>elementor-kit-12</code> ; eicons v5.53.0 referenced	The original site was built with the Elementor WordPress plugin; this project contains its static HTML/CSS output only — no Elementor editor or WordPress runtime is present	Throughout <code>GramyHospital.html</code> , <code>index.html</code> , all 14 specialist pages (via shared header/footer markup)	Present as static output only; not "implemented" as software
Elementor icon font (eicons)	v5.53.0	Bundled with Elementor's CSS	<code>elementor-icons.min.css</code>	Present but unused — zero <code>eicon-</code> classes found in any page
Tabler Icons	v2.46.0	Primary icon set (nav carets, card icons, buttons, social icons)	<code>tabler-icons.min.css</code> ; 72 <code>ti ti-*</code> class usages on the homepage	Actually used — font files fixed and verified this session
Flaticon (custom "Flaticon Hospa" set)	Custom, unversioned	Secondary icon set	<code>flaticon_hospa.css</code> ; 6 <code>flaticon-*</code> class usages	Actually used — font files fixed and verified this session

Technology	Version (if detectable)	Purpose	Where Used	Status
Font Awesome	v4.7.0 (<code>font-awesome.min.css</code>) and v5 free (<code>brands.css</code> / <code>solid.css</code>)	Bundled by the theme	<code>font-awesome.min.css</code> , <code>fontawesome.css</code> , <code>brands.css</code> , <code>solid.css</code>	Present, referenced from theme; zero fa / fas / fab classes found — unused
Owl Carousel	2.3.4	Doctor-card slider, lab-test carousel	<code>owl.carousel.min.js</code> download , used via <code>owl-carousel</code> classes	Actually used
Swiper	Bundled	Loaded by the theme/Elementor	<code>swiper-bundle.min.js</code> download , <code>swiper-bundle.min.css</code>	Present; no <code>swiper-container</code> / <code>swiper-wrapper</code> elements found in current markup — not verified as actively rendering a slider on these pages
PhotoSwipe	Bundled	Image lightbox gallery	<code>photoswipe.min.js</code> download , <code>photoswipe-ui-default.min.js</code> download , <code>default-skin.min.css</code>	Actually used — lightbox template and 2 trigger links confirmed present in the homepage markup
Magnific Popup	Bundled	Popup/lightbox helper	<code>magnific-popup.min.js</code> download	Present; loaded alongside PhotoSwipe — not fully verified which specific elements it drives
Leaflet	Bundled	Map library	<code>leaflet.js</code> download , <code>leaflet.css</code>	Present but unused — zero <code>#map</code> / <code>leaflet-container</code> elements found; "Our Locations" is a static text card, not an interactive map

Technology	Version (if detectable)	Purpose	Where Used	Status
WooCommerce front-end assets	Bundled	E-commerce cart/checkout UI	<code>woocommerce.css</code> , <code>woo-products.css</code> , <code>woocommerce-layout.css</code> , <code>add-to-cart.min.js.download</code> , <code>jquery.blockUI.min.js.download</code> , <code>sourcebuster.min.js.download</code> , <code>order-attribution.min.js.download</code>	Present, fully unused — no cart, checkout, or product page exists in this project
Google Fonts (Libre Franklin, Roboto)	—	Body and heading typography	Linked via <code><link></code> in <code><head></code> , and <code>GramyHospital_files/css2</code> , <code>css(1)</code>	Actually used (externally hosted — see §12 performance/§25 limitations for a font-fallback issue observed)
WordPress-origin metadata	—	oEmbed links, <code>xmlrpc.php</code> pingback link, RSS feed links, <code>wp-json</code> REST links	Present in <code><head></code> of every page	Referenced from the original site only — none of these WordPress endpoints exist or function locally
PHP	—	Not present	—	Not implemented — no <code>.php</code> file exists anywhere in the project
Image formats	PNG, JPEG/JPG, WebP, SVG, GIF (referenced, not present locally)	Photography and icons	<code>GramyHospital_files/</code> , <code>specialists/</code> , project root	Actually used (PNG/JPEG/WebP present; GIF referenced but missing — see §12)
Video formats	MP4	Homepage testimonial video	<code>WhatsApp-Video-2026-08-19-at-11.35.31-PM.mp4</code> (present locally, 16.3 MB, but the <code><video></code> tag references the remote copy — see §12)	Present locally but not referenced locally
Font formats	WOFF2, WOFF, TTF, EOT, SVG (font)	Icon and text fonts	<code>fonts/</code> (added this session), <code>GramyHospital_files/*.css @font-face</code> rules	Mixed — see §12 for the full breakdown

4. Programming / Markup / Style Languages

HTML

- **Role:** structural markup for all 16 real pages.
- **Main files:** `Gramy Hospital.html` (2,561 lines), `index.html` (byte-identical copy), 14 files under `specialists/`.
- **Approximate usage:** the homepage is a single very large HTML document (≈ 227 KB) combining a WordPress/Elementor-generated `<head>`, a shared header/footer, and homepage-specific sections. Each specialist page (≈ 120 – 133 KB) reuses the same head/header/footer verbatim plus page-specific breadcrumb, body content, and a doctor-card grid.

CSS

- **Role:** all visual styling — no CSS-in-JS, no CSS preprocessor output detected (no `.scss` / `.less` source files present, only compiled `.css`).
- **Main stylesheets:** `hospa-main.css` (652 KB — the theme's core stylesheet, includes the embedded Bootstrap grid), `hospa-responsive.css` (133 KB), `hospa-new-demo.css`, `hospa-blog.css`, `hospa-woocommerce.css`, `hospa-mobile-navbar.css`, plus Elementor's `frontend.css` / `frontend.min.css` and 20+ smaller vendor stylesheets (Owl Carousel, Swiper, PhotoSwipe, Magnific Popup, Leaflet, WooCommerce, Font Awesome, Tabler Icons, Flaticon, Elementor icons).
- **Major styling systems:** a Bootstrap 5 grid (container/row/col-lg-*) embedded directly inside `hospa-main.css`; CSS custom properties for theme colors (`--mainColor: #9588E8`, `--optionalColor: #0B55E5`); Elementor's own utility classes (`elementor-section`, `elementor-container`, `elementor-widget-wrap`).

JavaScript

- **Role:** carousel/slider behavior, mobile menu toggling (via Bootstrap's offcanvas component), lightbox galleries, and various WooCommerce/Elementor runtime scripts that are loaded but structurally inert on this project (no cart, no Elementor editor).
- **Main scripts:** `hospa-main.js.download` (the theme's own custom script — 7 KB), `bootstrap.bundle.min.js.download`, `owl.carousel.min.js.download`, `photoswipe.min.js.download` + `photoswipe-ui-default.min.js.download`, `magnific-popup.min.js.download`, `swiper-bundle.min.js.download`.
- **Interactive functionality confirmed:** mega-menu dropdowns (CSS `:hover` + `data-hover="dropdown"`), mobile offcanvas menu trigger (`data-bs-toggle="offcanvas"`), hero image carousel, doctor-card carousel, lab-test carousel, PhotoSwipe lightbox trigger elements. See §14 for the full table.

PHP / backend-related code

- **Not implemented locally.** No `.php` file exists anywhere in `D:\ho` (verified by a project-wide filename search). All WordPress-style references (`/wp-admin/admin-ajax.php`, `xmlrpc.php`, `wp-json` REST endpoints) are **static text left over from the original page save** — they are URLs pointing at `gramyhospital.com`'s real WordPress backend, not functionality present in this project. Clicking or triggering any of them would hit the live site, not a local server.

JSON / configuration formats

- `tools/specialists_data.json` — the structured content data (titles, body text, doctor lists, image URLs) extracted from the live site and used to generate the 14 specialist pages. This is project tooling, not part of the served website.
 - `package-lock.json` (81 bytes, at project root) — an empty npm lockfile stub (`"packages": {}`). No corresponding `package.json` exists anywhere in the project, and no `node_modules` directory exists. **Not verified** what originally created this file; it has no effect on the site.
-

5. System Architecture

A. High-Level System Architecture

B. Frontend Architecture

C. Page Navigation Architecture

D. Asset Loading Architecture

E. External Dependency Architecture

6. Website Page Structure

Page Inventory

#	File	Page Title	Purpose
1	Gramy Hospital.html	Gramy Hospital	Homepage
2	index.html	Gramy Hospital	Homepage (byte-identical duplicate, serves as the default document for <code>http://localhost:8000/</code>)
3	specialists/cosmetic-gynaecology.html	Cosmetic Gynaecology – Gramy Hospital	Speciality page
4	specialists/cosmetic-surgery.html	Cosmetic Surgery – Gramy Hospital	Speciality page
5	specialists/ent-surgery.html	ENT Surgery – Gramy Hospital	Speciality page
6	specialists/general-surgery.html	General Surgery – Gramy Hospital	Speciality page
7	specialists/robotic-surgery.html	Robotic Surgery – Gramy Hospital	Speciality page
8	specialists/gynecology.html	Gynecology – Gramy Hospital	Speciality page
9	specialists/orthopedic-surgery.html	Orthopedic Surgery – Gramy Hospital	Speciality page
10	specialists/neurology.html	Neurology – Gramy Hospital	Speciality page
11	specialists/aesthetic-medicine.html	Aesthetic Medicine – Gramy Hospital	Speciality page
12	specialists/prp-cartilage-rejuvenation.html	PRP & Cartilage Rejuvenation – Gramy Hospital	Speciality page
13	specialists/neurosurgery.html	Neurosurgery – Gramy Hospital	Speciality page
14	specialists/plastic-surgery.html	Plastic Surgery – Gramy Hospital	Speciality page
15	specialists/urology.html	Urology – Gramy Hospital	Speciality page

#	File	Page Title	Purpose
16	specialists/anti-ageing-nutrition-medicine.html	Anti-Ageing Nutrition Medicine – Gramy Hospital	Speciality page

Every page shares: the same `<head>` (CSS links, meta), the same header/mega-menu, and the same footer. Specialist pages additionally share a breadcrumb-banner component and a doctor-card grid component. See §7 for the 5 non-page template fragment files.

Page Hierarchy Diagram

7. Folder and File Structure

Generated from the actual filesystem on 2026-09-18 (top two levels; `Gramy Hospital_files/` contents summarized due to size — 125 files):

D:\ho	
└─ Anti-aging-Medicine-and-Wellness-800x530.png	(unreferenced by any page – orphan)
└─ Cosmetic-Gynecology-800x530.png	(unreferenced by any page – orphan)
└─ GRAMY_HOSPITAL_TECHNICAL_REPORT.md	(this report)
└─ Gramy Hospital.html	(homepage, 226,960 bytes)
└─ Gramy Hospital_files/	(125 files – CSS, JS, images; see below)
└─ specialists/	(24 images downloaded for the 14 specialist pages)

└─ newimg48-scaled.jpeg	(unreferenced by any page – orphan)
└─ newimg60-scaled.jpeg	(unreferenced by any page – orphan)
└─ package-lock.json	(81 bytes, empty stub – no package.json exists)
└─ specialists/	(14 HTML files, the specialist inner pages)
└─ tools/	(10 files – build/audit scripts, not part of the site)
└─ template-blocks/	(5 HTML fragments used to generate specialist pages)

Folder-by-folder explanation

Folder	Purpose	File types	Actively used?
Gramy Hospital_files/	The original browser-saved asset bundle: every CSS, JS, and image the homepage (and, by extension, the specialist pages) depends on	.css (37), .js.download (38 — the .download suffix is an artifact of how Chrome saved these), .png / .jpg / .jpeg / .webp / .svg images, plus 4 oddly-named files (css, css2, css(1), css(2)) which are Google Fonts CSS saved without an extension	Yes — this is the site's entire styling/scripting/image foundation
Gramy Hospital_files/specialists/	Images specifically downloaded for the 14 specialist pages (hero photos, doctor photos)	.jpeg, .png (24 files)	Yes
specialists/	The 14 specialist inner pages built this session	.html (14)	Yes
tools/	Python scripts and data used to build/verify/audit the site (content extraction, page generation, link patching, asset checking)	.py (9 scripts), .json (1 data file)	Build/maintenance tooling only — not served to website visitors
tools/template-blocks/	The 5 reusable HTML fragments (head, body-open, header, footer, closing scripts) that generate_specialists.py assembles into each specialist page	.html (5 fragments — not standalone pages)	Source-of-truth for regenerating specialist pages; not served directly
fonts/	Icon font binaries fetched from the live site this session, matching the path the existing CSS already expected (../fonts/...)	.woff2, .woff, .ttf, .eot, .svg (8 files)	Yes — fixes the Tabler Icons and Flaticon Hospa icon sets
img/	A single decorative background image (vector.png) fetched this session, matching the CSS's ../img/... path	.png (1 file)	Yes — used by the homepage's 8 "Our Services" cards

Orphaned root-level files

Anti-aging-Medicine-and-Wellness-800x530.png, Cosmetic-Gynecology-800x530.png, Surgical-Oncology-800x530.png, IMG-20260729-WA0010.jpg, newimg13-4.png, newimg48-scaled.jpeg, newimg60-scaled.jpeg, and WhatsApp-Video-2026-08-19-at-11.35.31-PM.mp4 sit at the project root but are **not referenced by any HTML**

file — identical copies of the images (except the video) exist and are actually used inside `Gramy Hospital_files/`. These appear to be leftover duplicates from the original save process.

8. Homepage Analysis

Section-by-section breakdown of `Gramy Hospital.html` / `index.html`, in document order:

Header

- **Structure:** a thin top bar ("Plan your visit by scheduling an appointment...") + main nav row (logo, About Us/Contact Us/Gallery/News/Blog links, mega-menu, Emergency button) + a duplicate offcanvas menu for mobile.
- **CSS classes:** `.top-header-area`, `.navbar`, `.mega-menu`, `.dropdown-toggle`, `.mobile-navbar.offcanvas`.
- **JavaScript:** Bootstrap's dropdown/offcanvas components (`data-bs-toggle="offcanvas"`, `data-hover="dropdown"`).
- **Images:** `gramy-hospital.png` logo (2 instances — standard + mobile).
- **Links/buttons:** 14 Specialities links (local), iMiss/Special/Diagnostic dropdown items (remote), Emergency `tel:` button.
- **Responsive behavior:** mobile nav toggle button is present and wired to Bootstrap's offcanvas JS, but its 3-bar visual indicator (`.burger-menu` with `.top-bar` / `.middle-bar` / `.bottom-bar` spans) does not render visibly at 390px width in verification screenshots — see §11 and §25.

Hero

- **Structure:** an Owl Carousel with 3 slides, each with a heading, subtext, and a "Call us now" button, plus a reception-desk photo and a "FIND A LOCATION" info bar.
- **CSS classes:** `.hero-slider` / `owl-carousel` (exact class name not independently re-verified in this pass — **not verified**), `.default-btn`.
- **Images:** reception desk photo (local); the "FIND A LOCATION" bar background uses an inline-styled image loaded from the live site (`newimg66.jpeg`, confirmed reachable — see §13).
- **Buttons:** "Call Us Now" (`tel:` link).

Visitor Info Cards (4-card row)

- **Structure:** "Visitor Information / Find a Doctor / Our Locations / Connect With Us," each a colored rounded card with an icon, text, and "Learn More" link.
- **Icons:** Tabler Icons (`ti ti-*`) — confirmed rendering correctly after this session's font fix.
- **Links:** all 4 "Learn More" links point to pages that don't exist locally (`/visitor-information/`, `/find-a-doctor/`, `/find-a-location/`, `/contact-us/`) — **not verified** whether these resolve to `gramyhospital.com` absolute URLs or broken local paths; based on the pattern established elsewhere in the project (out-of-scope links left as absolute `https://gramyhospital.com/...`), these are presumed remote.

About Hospital

- **Structure:** two-column layout — text block (heading, paragraph, 8-item checklist, "More About Us" button) + image with two floating stat badges ("22 Different Sections," "5K+ Patient's Reviews").
- **CSS class:** confirmed present via a real embedded testimonial `<video>` element nearby (see §12).
- **Icons:** Tabler checkmark icons on each of the 8 list items.

Our Services (8-card grid)

- **Structure:** "Radiology, Sonography, Microbiology, Surgery, Orthopedic, Neurology, Pathology, Anti-Ageing Nutrition Medicine" — 8 identical cards, each with an icon, heading, description, and "Read More" link.
- **Icons:** real downloaded PNG images (`pro-img3.png` , `pro-img6.png` , `pro-img4.png` , `syringe.png` , `bone.png` , `dna.png` , `pro-img8.png` , `pill.png`) — **not** font icons; confirmed rendering correctly in visual verification.
- **Decorative background:** `.services-card::after` uses `img/vector.png` , fixed this session.
- **Links:** 3 of the 8 cards (Surgery→General Surgery, Neurology, Anti-Ageing Nutrition Medicine) point to local specialist pages (fixed this session); the other 5 point to `/services-post/...` paths that don't exist locally.

Why Choose Gramy (3-icon row)

- **Structure:** "Patient-Centered Care / Advanced Medical Excellence / Comprehensive Specialty Care," each with a colored snowflake-style icon and a "Learn More" link.
- **Icons:** real downloaded PNG images (`img1.png` , `img2.png` , `img3.png`).

Lab Test Facilities

- **Structure:** a photo card ("Patient Care Excellence" badge over a surgical photo) beside a light-gray carousel box listing 8 lab tests (Orthopedists Test, Ultrasound, Prothrombin Time, Hemoglobin A1C, MRI & CT Scan, X-Rays, Urinalysis, Blood Test), each with a discount badge and "Schedule A Test" `tel:` button.
- **Background image:** `.lab-test-image` has both a (dead, unused) CSS default and a working inline-style image (`newimg14.jpeg` , confirmed reachable) — see §13.

Testimonials / "Expertise with Excellence"

- **Structure:** a large heading, a Google-rating badge ("4.9" with a star icon), two photos, and a carousel of patient quotes with reviewer name and photo.
- **Carousel:** Owl Carousel, confirmed present via prev/next arrow buttons in markup.

Download App promo

- **Structure:** "500+ Doctors" badge, app-store/play-store badge links (both point to placeholder `#` anchors, now resolving locally per this session's fix — they don't navigate anywhere functional, but no longer leave the page).

Healthcare Solution CTA

- **Structure:** a dark full-width banner ("Your Health Is Our Top Priority") over a photo background.
- **Background image:** `.solution-inner` — same dead-CSS/working-inline-style pattern as above (inline image `newimg33.jpeg` , confirmed reachable).

Blog & Articles

- **Structure:** 3 blog preview cards (Cosmetic Gynecology, Anti-aging Medicine, Surgical Oncology articles) with image, category tag, date, read time, and "Read More" — plus a "We have 1 more Articles. View All" bar.
- **Links:** all 3 article links and the "View All" link point to `gramyhospital.com` — no blog pages exist locally.

Footer

- **Structure:** 5 columns — For Patient, Centres of Excellence, Top Procedures, Corporate, Social Media — plus a locations/hours block, an advisory notice, and a copyright line.
 - **Links:** all footer links (except "Privacy Policy," which resolves locally to nowhere either — **not verified** if a local privacy-policy page exists; confirmed it does not) point to `gramyhospital.com`.
 - **Confirmed matching the live site closely** in structure and text (see §21).
-

9. Specialist / Inner Page Analysis

All 14 pages were inspected. Every page shares the same structural template (breadcrumb banner → hero image, if present → body content → "Available Doctors under [Speciality]" card grid → footer), generated from `tools/template-blocks/` + `tools/specialists_data.json` via `tools/generate_specialists.py`.

Page	Title	Main Content	Images	Doctor Cards	Unique Features / Issues
<code>cosmetic-gynaecology.html</code>	Cosmetic Gynaecology	9 content blocks (headings/paragraphs/lists)	Hero image present	1	—
<code>cosmetic-surgery.html</code>	Cosmetic Surgery	8 content blocks	Hero image present	3	—
<code>ent-surgery.html</code>	ENT Surgery	21 content blocks (longest structured article, with numbered lists)	Hero image present	3	Most heading-rich page (6 subheadings)
<code>general-surgery.html</code>	General Surgery	16 content blocks, plain-paragraph style (no subheadings)	Hero image present	1	—
<code>robotic-surgery.html</code>	Robotic Surgery	33 content blocks (most content of any page)	No hero image — source <code>robotic-surgery.webp</code> returns HTTP 404 on the live site itself	4	—
<code>gynecology.html</code>	Gynecology	17 content blocks, plain-paragraph style	Hero image present	2	—
<code>orthopedic-surgery.html</code>	Orthopedic Surgery	25 content blocks	No hero image — source <code>orthopedic-surgery.jpg</code> returns HTTP 404 on the live site itself	5	Most doctors listed of any page
<code>neurology.html</code>	Neurology	19 content blocks, plain-paragraph style	No hero image — source <code>Cosmetic-Surgery.webp</code> (a mismatched filename on the live site) returns HTTP 404	1	Live site itself reuses an unrelated image filename for this page's hero

Page	Title	Main Content	Images	Doctor Cards	Unique Features / Issues
aesthetic-medicine.html	Aesthetic Medicine	5 content blocks (shortest page)	Hero image present	1	Contains a known content quirk carried over verbatim from the source: a stray <code>
</code> merging two list items ("Chemical peels" / "Skin tightening procedures")
prp-cartilage-rejuvenation.html	PRP & Cartilage Rejuvenation	7 content blocks	Hero image present	1	Original page URL contained a non-printing Unicode word-joiner character before the slug; stripped for the local page
neurosurgery.html	Neurosurgery	21 content blocks	Hero image present	2	—
plastic-surgery.html	Plastic Surgery	32 content blocks	Hero image present	3	—
urology.html	Urology	21 content blocks	No hero image — source <code>Robotic-Heart-Surgery.avif</code> (mismatched filename) returns HTTP 404	2	—
anti-ageing-nutrition-medicine.html	Anti-Ageing Nutrition Medicine	3 content blocks (least structured content)	No hero image — source <code>Antiaging-and-Wellness-1.jpg</code> returns HTTP 404	1	—

Shared structure vs. page-specific content

Shared across all 14 pages: - Identical `<head>`, header/mega-menu, and footer (via `tools/template-blocks/A_head.html`, `C_header.html`, `D_footer.html`) - Identical breadcrumb-banner component (Home › [Speciality Name]) - Identical "Available Doctors under [Speciality]" card grid markup and CSS classes (`.doctor-card`, `.doctor-image`, `.doctor-content`) - All doctor "Book an appointment" buttons are `tel:` links, not profile-page links (doctor profile pages were explicitly out of scope for this build)

Page-specific: - Body text (headings, paragraphs, lists) — sourced verbatim from the corresponding live page - Hero image (present on 9 of 14 pages; absent on 5 where the live site's own source image is a dead link) - Doctor roster (1–5 real doctors per page, with real names, photos, and designations sourced from the

live site)

Intentionally omitted from every specialist page (confirmed absent by design, not by defect): the "Ask Any Question" contact form (requires a backend), and the "Related Services" sidebar widget seen on the live pages.

10. UI/UX Analysis

Concrete, observed findings only:

- **Layout:** desktop layout uses a Bootstrap-style grid (`container / row / col-lg-*`) consistently across the homepage and specialist pages. Section widths and gutters match the original site's proportions in side-by-side screenshot comparison (see §21).
 - **Navigation:** a persistent top nav with a hover-triggered mega-menu (desktop) and a click-triggered offcanvas panel (mobile). The 14 Specialities links and 3 of 8 "Our Services" links resolve locally; all other nav items resolve to the live domain.
 - **Visual hierarchy:** headings use a distinct larger/bolder serif-rendered typeface than body copy in this session's test renders (see §11 for the font-loading caveat); section eyebrows (e.g., "OUR SERVICES," "WHY CHOOSE GRAMY") are small, uppercase, letter-spaced, and colored with the accent blue.
 - **Typography:** the CSS declares `body{font-family:"Libre Franklin";}` with **no fallback font family listed**. In this session's headless-Chrome test renders (both at default and extended 20-second load waits), text rendered in a fallback serif font rather than Libre Franklin, despite the font file being independently confirmed reachable via direct request. **Not verified** whether this reproduces in a normal, non-automated browser session — flagged as an open question rather than a confirmed defect.
 - **Color system:** CSS custom properties define `--mainColor: #9588E8` (lavender) and `--optionalColor: #0B55E5` (blue); the footer uses a fixed navy (`#020D2B`). Card background colors (light blue, mint, lavender, peach) were confirmed matching the live site pixel-for-pixel in screenshot comparison.
 - **Buttons:** a consistent `.default-btn` pill-shaped button pattern (red fill, white text, circular icon-in-circle on the left) is used throughout for `te1:` CTAs.
 - **Cards:** consistent rounded-corner (`border-radius: 20px`) card pattern across service cards, doctor cards, and lab-test cards.
 - **Forms:** none exist (0 `<form>` elements found across all 16 pages).
 - **Spacing:** section vertical rhythm uses a repeated `.ptb-100` utility class (padding-top/bottom: 100px), confirmed present and applied consistently.
 - **Images:** 66 `<img>` tags on the homepage; 63 have descriptive `alt` text, 3 have empty `alt=""` (decorative images), 0 are missing the attribute entirely.
 - **Icons:** two icon systems are actually used (Tabler Icons, 72 uses; FlatIcon Hospa, 6 uses) — both fixed and confirmed rendering this session. Two more icon systems are loaded but completely unused (Font Awesome v4 and v5, Elementor's eicons).
 - **Accessibility observations:** 16 distinct `aria-*` attribute types found in use (`aria-label` ×16, `aria-expanded` ×5, `aria-haspopup` ×4, `aria-labelledby` ×4, `aria-live` ×2, `aria-current` , `aria-atomic` , `aria-hidden` , `aria-modal` , `aria-selected` — one each), indicating the original theme included accessibility affordances for its dropdowns and carousels, which carried over into this project unmodified.
 - **Mobile usability:** the mobile offcanvas menu button exists and is correctly wired to Bootstrap's JS, but its visual hamburger icon does not render (see §11, §25). All other tested sections reflow to a single column correctly at 390px width.
-

11. Responsive Design Analysis

Tested via headless Chrome at 1440px (desktop) and 390px (mobile) widths against the live local server.

Aspect	Desktop (1440px)	Mobile (390px)
Header	Full nav row with all top-level links and mega-menu visible on hover	Logo only; nav collapses to an offcanvas panel triggered by a button whose 3-bar icon does not visibly render (button itself is present and functional per markup inspection)
Navigation	Hover-triggered dropdowns	Click-triggered offcanvas (not independently click-tested in this pass — not verified whether the panel opens correctly, only that the trigger markup and Bootstrap JS are present)
Hero grid	Two-column (text + photo side-by-side)	Single column, photo below text — confirmed via screenshot to differ structurally from the live site's mobile hero, which overlays the hero text directly on top of a full-bleed photo; the local version instead shows text on a solid color block with the photo appearing as a separate element below
Card grids (services, visitor-info, doctors)	3–4 columns	Stack to 1 column, confirmed via screenshot
Images	Fixed-ratio containers with <code>background-size: cover</code> or <code>object-fit</code> -style scaling	Same pattern, images scale to container width correctly
Typography	See §10 font-fallback note	Same font-fallback behavior observed
Buttons	Full-size pill buttons	Same style, unchanged
Footer	5-column grid	Stacks to fewer columns (exact breakpoint behavior — not verified precisely)
Horizontal overflow	None observed	None observed in the sections tested

Responsive Architecture Diagram

12. Asset Analysis

Category summary

Category	Count	Examples
A. Actively used	Majority of the 125 files in <code>GramyHospital_files/</code> + all 9 assets added this session	<code>hospa-main.css</code> , <code>jquery.min.js.download</code> , <code>gramy-hospital.png</code> , <code>tabler-icons.woff2</code>
B. Used conditionally	PhotoSwipe lightbox assets	<code>default-skin.png</code> / <code>.svg</code> , <code>preloader.gif</code> — only load when a visitor opens the photo lightbox
C. Unused (confirmed, zero matching class in any page)	~30+ referenced-but-dead CSS rules	WooCommerce credit-card icons, Elementor eicons, Font Awesome v4/v5, other Hospa theme demo layouts (child-care-hospital, dental-clinic, general-hospital)
D. Legacy/browser-only	<code>.eot</code> and <code>.svg</code> font formats across every icon family	Never requested by any current browser regardless of whether the family is used
E. External/remote	Images and video still loaded from <code>gramyhospital.com</code>	3 homepage section backgrounds (inline style), homepage testimonial video + poster, all out-of-scope nav-link destinations
F. Missing/broken	5 specialist-page hero images, ~45 remaining dead CSS references (Category C/D above)	Confirmed dead on the live site itself, not a local-only gap

Key individual assets

Filename	Type	Location	Referencing file	Status	Purpose
<code>tabler-icons.woff2/.woff2/.ttf</code>	Font	<code>fonts/</code>	<code>tabler-icons.min.css</code>	Fixed this session, confirmed HTTP 200 and rendering	Primary icon set (72 uses)
<code>flaticon_hospa.woff2/.woff2/.ttf/.eot/.svg</code>	Font	<code>fonts/</code>	<code>flaticon_hospa.css</code>	Fixed this session, confirmed HTTP 200 and rendering	Secondary icon set (6 uses)
<code>vector.png</code>	Image	<code>img/</code>	<code>hospa-main.css</code> (<code>.services-card::after</code>)	Fixed this session, confirmed HTTP 200	Decorative corner graphic on 8 service cards
<code>WhatsApp-Video-2026-08-19-at-11.35.31-PM.mp4</code>	Video	Project root (16.3 MB)	Not referenced — the <code><video></code> tag in <code>Gramy Hospital.html</code> uses the remote URL instead	Present but unused locally	Homepage testimonial video
<code>newimg66.jpeg</code> , <code>newimg14.jpeg</code> , <code>newimg33.jpeg</code>	Image	Remote only (<code>gramyhospital.com/wp-content/uploads/...</code>)	Inline <code>style=</code> attributes on 3 homepage sections	External — confirmed reachable (HTTP 200)	Section background photos; the local CSS-default equivalents (<code>banner-bg.jpg</code> , <code>lab-test.jpg</code> , <code>solution.jpg</code>) do not exist anywhere, even on the live site, but are irrelevant since the inline style always wins
<code>Anti-aging-Medicine-and-Wellness-800x530.png</code> and 6 other root-level files	Image/video	Project root	None (orphaned)	Unused duplicates	Leftover from the original save

Performance-relevant sizes

- Largest single asset: the unreferenced homepage video (16.3 MB)
- Largest referenced assets: `tabler-icons.ttf` (2.17 MB), `image_941d836e.png` and `image_87923756.png` (≈1.8 MB each, both referenced), `flaticon_hospa.svg` (833 KB, an SVG font — see §18)
- Total project size: 41 MB

- Gramy Hospital_files/ : 15 MB · fonts/ : 5 MB · specialists/ : 1.8 MB · img/ : 8 KB
-

13. Broken Links and Assets

This section separates real problems from harmless dead references, per the categorization performed and verified earlier this session (cross-checked again for this report).

Real, user-visible problems

None remaining that were in scope. The 9 assets identified as visibly broken (all 3 icon-font families' primary formats, plus `vector.png`) were fixed and verified this session. A further investigation into 3 additional CSS background-image references (`medical-center-banner-area`, `lab-test-image`, `solution-inner`) found that those 3 sections already render correctly via inline-style overrides pointing to different, working, externally-hosted images — the underlying dead CSS default was confirmed to have zero visible effect.

Non-visible/low-impact problems

- PhotoSwipe's `default-skin.png` / `.svg` and `preloader.gif` remain unfetched at the theme's original relative path (**note:** these were not in the approved fix list and remain unresolved as 404s) — only matters if a visitor opens the photo lightbox.

Unused theme references (confirmed zero real class usage in current markup)

`assets/images/blog/*`, `assets/images/calendar-bg.jpg`, `assets/img/arrow.png`, `images/child-care-hospital/*`, `images/dental-clinic/*`, `images/general-hospital/*`, `images/icons/credit-cards/*` (8 files), `images/icons/loader.svg`, `images/map.jpg`, `img/cross-btn.png`, `Gramy Hospital_files/owl.video.play.png`, WooCommerce's `fonts/WooCommerce.*`, Elementor's `fonts/eicons.*`, both Font Awesome families (`fonts/fontawesome-webfont.*`, `webfonts/fa-brands-400.*`, `webfonts/fa-solid-900.*`).

Legacy browser-only formats

Every `.eot` reference (5 total) and every standalone SVG-font reference (3 total) across all icon families — never requested by any current browser due to `@font-face` format-list ordering, independent of whether the icon family itself is used.

Internal/external link check

- All 14 Specialities dropdown links (desktop + mobile) and 3 of 8 "Our Services" card links: confirmed resolving locally (HTTP 200, 0 redirects, tested directly against the running server).
 - All previously-broken placeholder `href="https://gramyhospital.com/#"` anchors (23 across the homepage, plus the same pattern in the specialist-page templates): confirmed fixed, zero remaining except one inert HTML comment.
 - Remaining nav items (iMiss/Special/Diagnostic, About/Contact/Gallery/News/Blog, footer Centres/Procedures, specialist-page "Related Services" links, doctor profile links): confirmed still pointing to `gramyhospital.com` — by design, since building those destination pages was out of scope for every task completed so far.
-

14. JavaScript / Interaction Analysis

Function	Trigger	JavaScript file	Result	Status
Desktop mega-menu dropdown	Mouse hover on nav item	CSS <code>:hover</code> + <code>hospa-main.js.download</code>	Submenu panel appears	Not independently click/hover-tested this session — markup and hover CSS confirmed present
Mobile offcanvas menu	Click on <code>.navbar-toggler</code> button	<code>bootstrap.bundle.min.js.download</code> (<code>data-bs-toggle="offcanvas"</code>)	Slide-out panel should open	Trigger markup confirmed present; panel open/close behavior not verified in this pass; the button's visual icon does not render (see §25)
Hero image carousel	Automatic + prev/next arrows	<code>owl.carousel.min.js.download</code>	Cycles through 3 hero slides	Confirmed animating — caught mid-transition in a screenshot during verification
Doctor-card carousel (specialist pages)	Automatic + swipe/arrows	<code>owl.carousel.min.js.download</code>	Cycles through doctor cards when more than ~3 exist	Confirmed rendering as a flex-wrapped grid (this project's own CSS override, added to guarantee visibility without requiring Elementor's runtime widget-init hooks — see §25 for why)
Lab-test carousel	Automatic + prev/next	<code>owl.carousel.min.js.download</code>	Cycles through 8 lab-test cards	Confirmed rendering with pagination dots visible in screenshots
Testimonial carousel	Automatic + prev/next arrows	<code>owl.carousel.min.js.download</code>	Cycles through patient quotes	Confirmed prev/next buttons present in markup
Photo lightbox	Click on a gallery trigger link	<code>photoswipe.min.js.download</code> + <code>photoswipe-ui-default.min.js.download</code>	Full-screen image viewer opens	Trigger markup (2 links) and lightbox template confirmed present; not independently click-tested this session
Popup helper	Unknown specific trigger	<code>magnific-popup.min.js.download</code>	Not verified which elements this drives	Loaded but its specific usage was not isolated in this audit

Function	Trigger	JavaScript file	Result	Status
Video playback	Click play on the <code><video></code> element	Native HTML5 <code><video controls></code> , no custom JS	Plays the remote-hosted testimonial video	Confirmed element present with <code>controls</code> , <code>poster</code> , and <code>preload="metadata"</code> attributes
Scroll-to-top button	Click	<code>hospa-main.js.download</code> (assumed — not isolated)	Smooth-scrolls to page top	Button markup (<code>#backtotop</code>) confirmed present in the footer template
Forms	N/A	N/A	N/A	Not applicable — zero <code><form></code> elements exist anywhere in the project
AJAX / API calls	N/A	WooCommerce scripts reference <code>/wp-admin/admin-ajax.php</code>	Would call the live WordPress backend, not any local endpoint	Present as dead code only — no local server-side handler exists to receive such a call

15. Backend Analysis

Finding: this project has no backend of any kind, implemented locally.

- No `.php`, `.py` (server-side), `.js` (Node.js server), or any other server-side application file exists anywhere in `D:\ho`, other than the Python **audit/build tooling** in `tools/` (which are one-off scripts run manually by a developer — they are not a running server component, do not respond to HTTP requests from the website, and are not referenced by any HTML page).
- The `python -m http.server 8000` process used to view the site is a **generic static file server** built into Python's standard library. It serves files as-is; it does not execute any code, process any form submission, or connect to any database.
- Every WordPress-style reference in the HTML (`/wp-admin/admin-ajax.php`, `/wp-json/...`, `xmlrpc.php`) is **referenced from the original website only** — these are URLs that, if triggered, would attempt to contact `gramyhospital.com`'s real backend (which this project has no access to or knowledge of beyond its public-facing pages), not anything running locally.
- No authentication, session handling, or user-account functionality exists anywhere.
- No form-processing logic exists anywhere (consistent with §14: zero `<form>` elements).

Conclusion: 100% referenced from the original website, 0% implemented locally.

16. Database Analysis

Finding: no database exists in this project.

- No SQLite file (`.db` , `.sqlite`), no MySQL/PostgreSQL connection code or config, and no ORM or query code of any kind was found.
- The only structured data storage in the project is `tools/specialists_data.json` — a static JSON file used once, by a build script, to generate the 14 specialist HTML pages. It is not queried at runtime, not loaded by any page a visitor sees, and functions purely as a content snapshot, not a database.
- No `localStorage` / `sessionStorage` / `IndexedDB` usage was found in any custom script (`hospa-main.js.download` was the only project-relevant custom script; the browser storage capability, if present, would originate from third-party vendor scripts like WooCommerce's cart-persistence code — **not verified** whether any vendor script actually invokes browser storage on these specific pages, since no cart/product functionality is present to trigger it).
- No API endpoints are called by any page at runtime (the WooCommerce AJAX URL is defined in a JS variable but not verified to ever be actually called, given no cart/add-to-cart UI is present in the rendered markup).

Conclusion: no database, local or remote, is implemented or connected.

17. Security Analysis

Basic client-side/static review only — this is not a penetration test.

Check	Finding
Hardcoded credentials	None found. A search for <code>api_key</code> , <code>secret</code> , <code>password</code> , <code>token</code> patterns across the HTML found only harmless UI text (<code>"i18n_password_show":"Show password"</code> , <code>"i18n_password_hide":"Hide password"</code> — WooCommerce's client-side label strings, not real credentials)
API keys	None found
Sensitive information	None found
Unsafe external scripts	All actual <code><script src= "... "></code> tags load from the local <code>Gramy Hospital_files/</code> folder; the only truly external script-capable domains (<code>unpkg.com</code> , <code>cdn.jsdelivr.net</code>) are present only as <code>dns-prefetch</code> hints with no actual <code><script src></code> pointing at them
Mixed content	One <code>http://</code> (non-HTTPS) link found: <code><link rel="profile" href="http://gmpg.org/xfn/11"></code> — a metadata-only link (XFN microformat spec reference) that browsers do not fetch as a resource; not an active mixed-content risk
Insecure links	The 3 homepage section backgrounds and the testimonial video load over HTTPS from <code>gramyhospital.com</code> — no insecure (HTTP) resource loads were found
Form security	Not applicable — no forms exist
Client-side-only validation	Not applicable — no forms exist
Third-party dependencies	All vendor libraries (jQuery, Bootstrap, Owl Carousel, Swiper, PhotoSwipe, Magnific Popup, Leaflet, WooCommerce scripts) are bundled locally as static files, not pulled from a live CDN at request time — their version numbers and any known CVEs were not checked in this audit

Conclusion: no exposed secrets or credentials; the project's security posture is that of a static, no-backend website — the main relevant risk category (server-side vulnerabilities, injection, auth bypass) does not apply because no server-side code exists.

18. Performance Analysis

Metric	Finding
Total project size	41 MB
Number of CSS files loaded per page	37
Number of JS files loaded per page	38
Largest referenced image	<code>image_941d836e.png</code> / <code>image_87923756.png</code> , ≈1.8 MB each
Largest font file	<code>tabler-icons.ttf</code> , 2.17 MB (note: <code>.ttf</code> is a fallback format modern browsers won't actually fetch once <code>.woff2</code> succeeds — the real cost per page load is <code>tabler-icons.woff2</code> at 776 KB)
Largest unreferenced asset	The homepage testimonial video, 16.3 MB, sitting unused at the project root while the page instead streams the same content from the live site
Render-blocking resources	37 CSS files are linked as standard blocking <code><link rel="stylesheet"></code> tags in <code><head></code> (one exception noted: <code>hospa-main.css</code> loads via a <code>preload + onload</code> pattern) — a real-world page load would block on a large number of small requests before first paint
Duplicate assets	<code>index.html</code> and <code>Gramy Hospital.html</code> are byte-identical (226,960 bytes each) — the site effectively ships the same 227 KB document twice; several images are duplicated between the project root and <code>Gramy Hospital_files/</code> (see §7 orphan list)
Unused CSS/asset weight	A significant share of the 37 loaded CSS files styles features not present anywhere in the markup (WooCommerce checkout, Leaflet maps, 3 unused icon-font families, several Hospa theme demo layouts) — these are downloaded and parsed by the browser on every page load even though they affect nothing visible
Font loading strategy	Google Fonts (Libre Franklin, Roboto) loaded via external <code><link></code> , with a <code><noscript></code> fallback; local icon fonts loaded via standard blocking <code>@font-face</code> declarations, no <code>font-display</code> swap strategy confirmed for the icon fonts specifically

Optimization opportunities identified (not acted on, per read-only scope): removing the 4 fully-unused vendor CSS/JS bundles (WooCommerce, Leaflet, Font Awesome ×2, Elementor icons) would reduce per-page-load weight without any visible change; deduplicating `index.html` / `Gramy Hospital.html` ; removing the 7 orphaned root-level files; referencing the local video file instead of the remote copy.

19. SEO Analysis

Element	Homepage	Specialist pages
<title>	Present: "Gramy Hospital"	Present, unique per page: e.g. "Neurology – Gramy Hospital"
Meta description	Missing — zero <meta name="description"> tags found on any page	Missing
Viewport meta	Present: width=device-width, initial-scale=1	Present (shared head template)
Heading hierarchy	1 <h1>, 9 <h2> — a single, correctly-used top-level heading	Each page confirmed to have exactly 1 <h1> (the breadcrumb-banner speciality name) — verified during specialist-page build via automated check
Canonical URL	Present: https://gramyhospital.com/ (points at the live site, not the local one)	Present, per page: e.g. https://gramyhospital.com/neurology/ (also points live)
Open Graph tags	Missing — zero og:* meta tags found	Not independently re-checked , but inherited from the same head template — presumed also missing
Twitter Card tags	Missing — zero twitter:* meta tags found	Presumed also missing
Robots meta	Present: <meta name="robots" content="max-image-preview:large"> (an image-preview hint, not a noindex/nofollow directive)	Present (shared head template)
Sitemap reference	Not found in any page <head>; no sitemap.xml file exists in the project	Same
Image alt text	63 of 66 homepage tags have descriptive alt text; 3 have empty alt="" (appropriate for decorative images); 0 missing entirely	Not independently re-audited per specialist page in this report pass
Semantic HTML	<header>, <footer>, <nav> - equivalent (role attributes used on some elements) present; overall structure is a typical WordPress/Elementor <div>-heavy output rather than a lean semantic document	Same pattern

Element	Homepage	Specialist pages
Internal linking	14 specialist pages properly interlink via the shared mega-menu; the homepage's "Our Services" grid links to only 3 of its 8 relevant pages	Each specialist page links back to the homepage via its breadcrumb

Key gap: the canonical URLs on every page point to the **live** `gramyhospital.com` domain rather than `localhost` , meaning if this project were ever deployed as-is to a different real domain, every page would self-identify (for search engines) as belonging to `gramyhospital.com` instead. This was not in scope to fix in prior sessions and remains present.

20. Accessibility Analysis

No formal WCAG audit or automated accessibility scanner was run. The following are direct code observations only.

- **Alt attributes:** strong coverage on the homepage (63/66 images with descriptive text, 3 intentionally empty for decorative images, 0 missing).
- **Button labels:** the mobile nav toggle button has no visible text and no `aria-label` confirmed in the markup snippet inspected — **not verified** whether an accessible name is provided by another means (e.g., screen-reader-only text elsewhere in the button).
- **Link labels:** most links use descriptive text ("Learn More," "Read More," "Schedule A Test") rather than generic "click here" patterns; several icon-only links (social media icons) were **not individually checked** for `aria-label` coverage in this pass.
- **Form labels:** not applicable — no forms exist.
- **Keyboard accessibility indicators:** a `.hfe-skip-link` "Skip to main content" link is present at the very top of the document (standard accessibility pattern), confirmed fixed to point locally (`href="#content"`) rather than to the live site.
- **Color contrast: not tested** — no contrast-ratio measurement tool was run against the rendered colors in this audit.
- **Heading structure:** confirmed logical on the homepage (single `<h1>` , followed by `<h2>` section headings) and on specialist pages (single `<h1>` per page).
- **ARIA usage:** confirmed present and reasonably thorough — `aria-label` , `aria-expanded` , `aria-haspopup` , `aria-labelledby` , `aria-live` , `aria-current` , `aria-atomic` , `aria-hidden` , `aria-modal` , `aria-selected` all found in use across the homepage, inherited from the original theme's markup.
- **Focus behavior: not tested** — no keyboard-navigation walkthrough was performed in this audit.

Conclusion: the project inherits a reasonably accessible foundation from the original WordPress theme (semantic landmarks, ARIA attributes, skip link, mostly-complete alt text), but no independent verification of actual assistive-technology usability (screen reader testing, keyboard-only navigation, contrast ratios) was performed. Do not represent this project as WCAG-compliant without that testing.

21. Original Website vs. Local Website

Comparison performed by rendering both sites (live site via a screenshot API; local site via headless Chrome against the running `localhost:8000` server) at matching viewport widths, plus direct filesystem/code inspection. This table consolidates findings from the dedicated audit performed earlier this session.

Area	Original (gramyhospital.com)	Local (localhost:8000)	Difference	Evidence
Overall homepage structure	Full section order as documented in §8	Same section order, same section count	None found	Side-by-side full-page screenshot comparison
Text/content	Source content, including known copy quirks (e.g., "We Provide Finnest Patient's Care & Amenities," an advisory notice that misnames the hospital as "Max Hospitals")	Same text, including the same quirks, carried over verbatim	None found	Line-by-line text extraction and comparison
Images	Full photography set	Homepage images match; 5 of 14 specialist pages lack a hero image because the live site's own source image returns HTTP 404	Local gap is a direct consequence of a live-site defect, not a local omission	Direct HTTP requests to each source URL, repeated to rule out transient failure
Layout/colors	As designed	Confirmed matching card background colors, footer navy, button colors	None found in tested sections	Screenshot color comparison
Typography	Libre Franklin body font, likely Roboto or inherited sans-serif for headings	Rendered in a fallback serif font in this session's automated test renders	Confirmed different in test conditions; not verified whether a normal user's browser would also see this, since the font file is independently reachable	Headless Chrome render with 20-second load wait; direct HTTP check of the font URL
Header	Full two-row header (announcement bar + nav)	Same two-row header present and confirmed rendering	None found	Screenshot comparison
Footer	5-column footer with advisory notice	Identical structure and text	None found	Screenshot and text comparison
Navigation	All links point within the live site	14 Specialities links + 3 "Our Services" links point locally; all other nav items point to the live site (by design, out of scope)	Intentional, documented gap	Direct HTTP status checks (0 redirects, 200 OK for in-scope links)

Area	Original (gramyhospital.com)	Local (localhost:8000)	Difference	Evidence
Specialist pages	14 pages matching this project's 14, plus ~14 more (iMiss/Special/Diagnostic categories) not replicated	14 pages built, content sourced directly from each live page	Content match confirmed close for pages visually spot-checked (Orthopedic Surgery, ENT Surgery, Robotic Surgery, Neurology); not verified individually for the remaining 10	Screenshot comparison for 4 of 14 pages; automated link/image checks for all 14
Buttons	Red/blue pill CTAs	Same style, same colors	None found	Screenshot comparison
Interactive functionality	Working contact form, doctor-profile links, related-services sidebar	Contact form and related-services sidebar intentionally not built; doctor names are plain text, not links	Documented, intentional scope gap	Code inspection
Responsive/mobile	Hero text overlays a full-bleed photo; visible hamburger menu icon	Hero text sits on a solid-color block above a separate photo; hamburger icon invisible	Confirmed structural/rendering difference	Mobile-width screenshot comparison
Assets	All theme/font assets served from the live server	9 of 9 assets identified as visibly necessary were fixed and verified this session (icon fonts, 1 decorative background); ~45 further dead references confirmed to have no visible effect	Substantially resolved for anything with real visual impact	HTTP status checks against the running local server
Links	All internal	Mixed — see Navigation row above	Documented	HTTP status checks
Site breadth	~150 pages (About, Contact, Gallery, News, Blog, 28 doctor profiles, 8 service pages, 8 lab-test pages, careers, events, shop)	16 pages (homepage + 14 specialist pages)	Largest gap between the two sites	Live sitemap XML inspection (137 pages, 28 doctors, 8 services, 8 lab-tests, 4 blog posts, 6 careers, 7 events, 8 products, per earlier sitemap audit)

Last full visual-match audit result: 70% overall match (category breakdown available in the earlier audit's published report; not reproduced in full here to avoid duplicating that artifact, but its findings are reflected throughout this section).

22. Functional Testing

Test	Expected	Actual	Status
Homepage loads via <code>python -m http.server 8000</code>	Page renders fully at <code>http://localhost:8000/</code>	Confirmed: HTTP 200, 0 redirects, full page content served	Pass
Homepage loads at <code>Gramy%20Hospital.html</code>	Page renders identically to <code>index.html</code>	Confirmed byte-identical file, same rendering	Pass
Clicking a "Specialities" dropdown item	Opens the matching local specialist page	Confirmed via direct HTTP request (200, 0 redirects) for all 14	Pass
Clicking "Surgery"/"Neurology"/"Anti-Ageing Nutrition Medicine" service cards	Opens the matching local specialist page	Confirmed fixed and verified this session	Pass
Clicking other nav items (iMiss, Special, Diagnostic, About Us, etc.)	Navigates to <code>gramyhospital.com</code>	Confirmed by design — these were never brought local	Expected behavior, not a defect
Clicking dropdown-toggle text, social icons, footer compliance links	Previously navigated to <code>gramyhospital.com/#</code> ; now should stay on the page	Confirmed fixed — 23 placeholder links now resolve to local <code>#</code> anchors	Pass
Mobile menu button click → panel opens	Offcanvas panel slides out	Not tested — headless screenshot verification does not simulate a click-and-observe interaction; only the trigger markup was confirmed present	Not verified
Hero slider auto-advances	Cycles through 3 slides	Confirmed — caught mid-transition in a screenshot	Pass
Photo lightbox opens on click	Full-screen image viewer	Not tested — trigger markup and lightbox template confirmed present, but no click was simulated	Not verified
Footer links	Navigate to the destination shown	Confirmed resolving (mix of local specialist links being N/A here, and remote <code>gramyhospital.com</code> links, consistent with documented scope)	Pass (as designed)
External links (e.g., footer Privacy Policy)	Navigate to <code>gramyhospital.com</code>	Consistent with documented scope	Pass (as designed)

Test	Expected	Actual	Status
Icon rendering across the site	All <code>ti ti-*</code> and <code>flaticon-*</code> icons visible	Confirmed via fresh screenshot after this session's font fix — visitor-info card icons, button icons, and location-card icon all render correctly	Pass
Doctor-card display on specialist pages	Real doctor names/photos/designations show	Confirmed via screenshot on ENT Surgery (3 doctors) with correct photos and titles	Pass

23. Browser / Console / Network Check

Performed via direct HTTP requests against the running local server and a project-wide static reference scan (headless-browser console log capture was **not** performed in this specific pass — findings below are from HTTP status checks and static analysis, not a live DevTools console).

Category	Finding
HTTP 200	All in-scope navigation (14 Specialities links, 3 service-card links), all 9 assets fixed this session, homepage and all 14 specialist pages themselves
HTTP 404	~45 remaining dead asset references (see §13 for the full breakdown by category); the theme-default background images for 3 homepage sections (confirmed to have zero visible effect since an inline style always wins); <code>/favicon.ico</code> (browser's automatic default request — nothing in the code asks for it)
HTTP 500	None observed — this is a static file server with no application code capable of producing a server error
JavaScript errors	Not verified — no live browser console log was captured in this specific report pass; recommend a manual DevTools check to confirm
CSS errors	Not applicable in the traditional sense (invalid CSS doesn't throw console errors, it silently fails to apply) — no CSS validation was run
Font errors	Confirmed resolved for the 9 assets fixed this session; ~13 remaining font-family 404s exist but are confirmed unused by any class present in the markup (see §13)
Image errors	Confirmed resolved for <code>vector.png</code> ; 5 specialist-page hero images intentionally absent (dead live-site source); remaining image 404s confirmed to be unused theme-demo references
External resource failures	Not verified this session whether <code>gramyhospital.com</code> (used for out-of-scope nav links, 3 section backgrounds, and the testimonial video) is reachable at the moment a reader tests this — it was reachable throughout this and prior sessions' testing

24. Diagrams

All diagrams requested in §5, §6, and §11 are included above, in their respective sections, to keep each diagram next to its explanatory text. Two additional diagrams follow.

User Journey

Original vs. Local Architecture

25. Current Project Limitations

Frontend limitations

- Mobile hamburger menu icon does not render (root cause not fully diagnosed — the toggle button and its 3 `<span>` "bar" elements exist in the markup, but no visible styling was observed at 390px width in testing).
- Body/heading text renders in a fallback serif font in automated test conditions, rather than the intended Libre Franklin/Roboto sans-serif (see §10, §21 for the verification caveat).
- Mobile hero section layout structurally differs from the live site (text-on-solid-block vs. text-over-photo).
- Doctor-card carousels on specialist pages render as a static flex-wrapped grid rather than a true sliding carousel, because the markup does not include Elementor's specific widget-initialization data attributes that would normally trigger Owl Carousel's JS automatically — this was a deliberate, documented workaround from the specialist-page build, not an accidental defect.

Backend limitations

- No backend exists at all. No contact form, no appointment-booking system, no server-side logic of any kind.

Database limitations

- No database exists. Any future dynamic feature (search, filtering, admin content management) would need one built from scratch.

Asset limitations

- 5 of 14 specialist pages lack a hero image because the live site's own source file is missing.
- ~45 CSS asset references remain unresolved (404), though confirmed to have no visible impact.
- 8 root-level files (7 images + 1 video) are orphaned duplicates, unreferenced by any page.
- The homepage's 3 background-critical sections rely on live, externally-hosted images rather than local copies.

SEO limitations

- No meta description on any page.
- No Open Graph or Twitter Card tags anywhere.
- Canonical URLs on every page point to the live `gramyhospital.com` domain, not the local site.
- No sitemap file exists.

Accessibility limitations

- No formal WCAG testing, contrast-ratio measurement, or screen-reader walkthrough has been performed.
- The mobile menu button's accessible name (if any) was not confirmed.

Performance limitations

- 37 CSS files and 38 JS files load on every page view, a majority of which style/drive features (WooCommerce, Leaflet, 3 unused icon fonts) that are not used anywhere in the project.
- `index.html` and `Gramy Hospital.html` duplicate the same 227 KB document.
- A 16.3 MB video sits unused at the project root while the page streams the same content remotely.

Deployment limitations

- The project has only ever been tested via Python's built-in development server (`python -m http.server`), which is not a production-grade web server (no HTTPS, no caching headers, no compression, single-threaded).
 - No build step, bundler, or minification pipeline exists — all vendor files are already-minified copies from the original site, but the project's own custom pages are unminified, unbundled HTML.
-

26. Recommendations

Priority 1 — Important

1. Diagnose and fix the mobile hamburger menu icon (affects real mobile usability).
2. Investigate the font-fallback issue in a real (non-automated) browser to confirm whether it affects actual visitors, not just this session's headless test environment.
3. Add meta descriptions to the homepage and all 14 specialist pages (single highest-value SEO fix available without new content).
4. Correct the canonical URLs to point at wherever this project is actually deployed, rather than the live `gramyhospital.com` domain, before any real deployment.

Priority 2 — Useful

5. Localize the 3 externally-hosted homepage section-background images (and the testimonial video) so the homepage has no live-internet dependency.
6. Remove the 4 fully-unused vendor CSS/JS bundles (WooCommerce, Leaflet, both unused Font Awesome sets, Elementor icons) to reduce page weight — verify nothing else depends on them first.
7. Deduplicate `index.html` / `Gramy Hospital.html` (e.g., make one a lightweight reference to the other) and remove the 7 orphaned root-level files.
8. Add Open Graph tags for better link-preview behavior when the site is shared.
9. Perform a real accessibility pass (contrast check, keyboard-navigation walkthrough, screen-reader spot check).

Priority 3 — Optional

10. Build the remaining ~136 live-site pages (About Us, Contact Us, Gallery, News, Blog, doctor profiles, service/lab-test pages) if full site parity is ever desired.
 11. Build a real contact/appointment form, which would require adding a backend for the first time.
 12. Replace Python's development server with a production-appropriate static host if this project is ever deployed publicly.
 13. Investigate the Magnific Popup library's actual usage on this site, since it was loaded but not isolated to specific elements in this audit.
-

27. Final Technical Summary

What has been built: a static, 16-page front-end reproduction of the Gramy Hospital website — one homepage (duplicated as `index.html`) plus 14 medical-speciality inner pages, each with real content, images, and doctor listings sourced directly from the live site.

Technologies used: HTML5, CSS3, and JavaScript, built on top of a captured WordPress/Elementor theme's static output (Bootstrap 5 grid, jQuery, Owl Carousel, Swiper, PhotoSwipe, Magnific Popup), with two working icon-font systems (Tabler Icons, Flaticon Hospa) and externally-hosted Google Fonts.

Number of pages: 16 real, navigable pages (homepage + 14 specialist pages); 5 further `.html` files exist only as internal template fragments used to build the specialist pages, not as standalone site pages.

Architecture: a purely static site with no application tier — a generic HTTP file server delivers pre-built HTML, CSS, JS, image, and font files directly to the browser, with no processing step in between.

Frontend status: functionally complete and visually close to the original for the pages that exist; two known open issues (mobile hamburger icon, font fallback) and one known structural mobile difference (hero section layout) remain unresolved as of this report.

Backend status: not implemented. All backend-shaped code present in the project (WordPress AJAX URLs, REST endpoints) is inert static text referencing the original site's real backend, which this project has no connection to.

Database status: not implemented. No database of any kind exists.

Asset status: the 9 assets identified as having real visible impact were fetched from the original site and fixed this session, verified via both HTTP status checks and visual screenshot comparison. Approximately 45 further asset references remain unresolved but were individually confirmed to have no visible effect, since nothing in the current markup actually uses them.

Functionality status: navigation, carousels, and the photo lightbox trigger markup are all present and (where testable via HTTP/screenshot) confirmed working; forms, doctor-profile pages, and a working search do not exist. Every call-to-action on the site is a phone-call link, not a web form.

Responsive status: desktop layout confirmed matching the original closely; mobile layout is functional for most sections but has 2 confirmed open issues (menu icon, hero structure) relative to the original.

Major remaining work: building the ~136 pages of the live site not yet represented locally is by far the largest gap, followed by resolving the two open frontend rendering issues and adding basic SEO metadata.

This report was generated through direct, read-only inspection of the project filesystem and the site as rendered by a running local HTTP server, cross-referenced against the live site at <https://gramyhospital.com/> where a comparison was requested. No project file (other than this report) was created, modified, deleted, renamed, or moved during this audit. Any finding not independently verified in this pass is explicitly marked "Not verified" above rather than assumed.
